# **SUH DUDE**

Team D

### Introduction

- SUH DUDE is a web application that provides data to entrepreneurs seeking information about where to start their new business
- Intended to be simple and easy-to-use, without making users navigate between several different pages
- Displays demographic information to help entrepreneurs decide what the ideal location is for their business

### Background

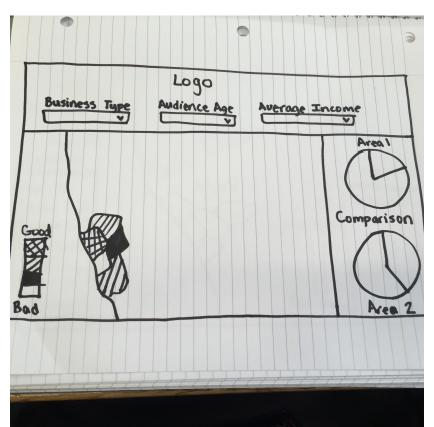

- Originally considered using Delphi data to help people who are moving live near a similar demographic
  - Married people could live near other married people, single people could live near other single people
- Realized most people don't move just to be closer to others with the same relationship status
- But that information could be useful for businesses...

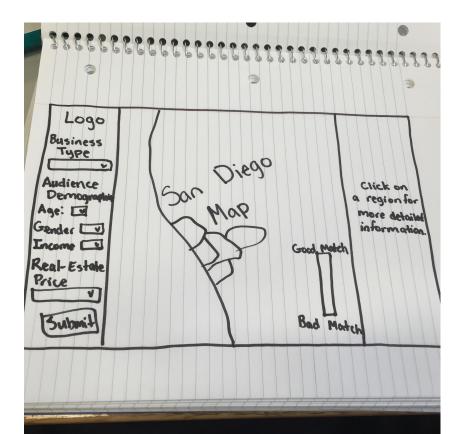

### Design

- Started prototyping for an app to tell entrepreneurs where their business would be most successful
- Required user input of business type and information about the target demographic
- Referred to HCI design principles through the process
  - Consistency and standards
  - Match between system and real world
  - Help and documentation

### **Architecture**

#### **Features**

- Heat map to help users see what regions of San Diego are the most densely populated
- Donut charts displaying demographic information in 6 categories
  - Age
  - Race
  - Gender
  - Marital Status
  - Income
  - Expenditures
- Detailed population information about each region
- In-app assistance to help first-time users understand how to use the app

# **User Testing**

- Collected feedback from other UCSD students
- Used feedback to narrow down scope of our app
- Changed color scheme to be more user-friendly

### **Lessons Learned**

- Communication is <u>very</u> important
- Set small goals, and don't move on from those until they're done
- Start early, and meet up as regularly as possible so everyone is on the same page

#### **Future**

- Expand reach to outside of the San Diego area
- More data!
  - Information about other successful businesses
  - More historical data so users can see trends.
- Data Filters
  - Alternative ways to find data
  - Eg. Find area that spends the most on entertainment and recreation
- Combine Data
  - Ex. Filter by single men or married women
